WHERE IT GOES

This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Two brackets, one above the other, each an arm and a stub:

arm 117.5 long along the rail line, stub 30.5 long out to the head tube; lower bracket centred 745 up, upper 805 up.

Weld each stub square to the end of its arm (an L), then cope the stub's free end to the 44 mm head tube.

Jig the head tube upright 385 out from the centre line and 60 behind the rear axle line, its bottom 730 above the ground.

Weld both stubs to the head tube, then both arm ends to the rear face of the hip sleeve (left and right are mirror images).

Pin guide: 14 mm tube 57 long welded upright on the upper stub, 45 in from the head tube axis; drill the stub top 9 mm under it.

Face both head tube ends square and ream the bore to the headset maker's size (34 mm for external cups).

Check: head tube upright both ways within 0.5 degree.

WATERWALKER
